

# LAVA Parallel-PCIe/LP Quick Installation Guide

---

---

Rev.A00

## Windows Hardware and Driver Installation

1. Before opening the casing of your computer, make sure that all power is off.
2. Locate an unused PCIe slot and insert the Parallel-PCIe/LP card into it. Ensure that the card is well seated.
3. Screw the metal bracket of the Parallel-PCIe/LP card to your PC's casing and replace the machine's cover.
4. Connect your parallel cable to the port on the Parallel-PCIe/LP card and turn the PC on.
5. When Windows starts, it will find a Parallel-PCIe/LP Controller and will ask you for a driver for this device. When prompted, insert the installation CD into your computer. After copying the necessary files from the CD, Windows may restart your PC in order to complete the installation of the Parallel-PCIe/LP card. Windows XP/Vista may display a message to the effect that the drivers are not digitally signed. This warning can be ignored.
6. The Parallel-PCIe/LP card will appear in Control Panel\System|Device Manager under Ports, as a listing similar to the one below. If required, settings may be customized by clicking on the Parallel-PCIe listing and then clicking Properties.

## **Release Notes:**

- A. Because the Parallel-PCIe/LP card uses PCIe (not ISA) I/O address ranges, it will never be seen by your BIOS at boot-up as a standard parallel port (occupying 0278h or 0378h) even if the address has been changed in Windows using the above procedure. This is normal, and does not indicate a fault in your Parallel-PCIe/LP card.
- B. In standard installations of Windows 2000/XP/Vista, the I/O address cannot be changed to a legacy address.
